1. End-to-End Flow Diagram

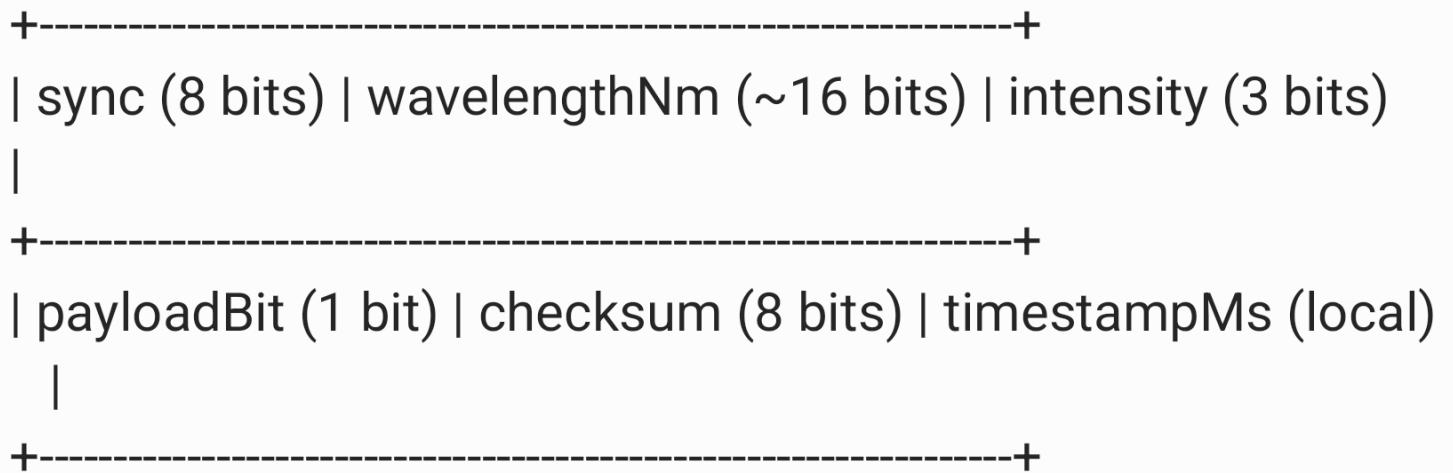

```
=====
```

2. Frame Structure

A single WNSP frame (v1.0):

Conceptually:

- sync: helps receiver lock onto frame boundaries
- wavelengthNm: primary symbol (maps back to a letter)
- intensity: brightness level for adaptation and metadata
- payloadBit: 0/1, can be used as parity or future data
- checksum: basic XOR over core fields, for error detection
- timestampMs: local metadata; not required for correctness

=====

3. Mesh Node Interaction

=====
